CCI Driving Manufacturing Productivity for Over Two Decades

Virtual Server

Machine Tools Anywhere

While our competitors claim to support relational databases in their applications when you look closely you can see that they are really folder based systems.

Relational vs. Folder Databases

As an example take a look at how they require you to setup remote requests for accessing directories, files, etc. Upon investigating you realize that they have built their system on the old folder based technologies. They require you to select each server and its complicated folder-path-names relationships. That is exactly what a database is supposed to shield you from, the error prone details that are inherent if folder based systems.

Did you know?

By the way with SuiteFactory you only need one Server (SuiteFactory's Virtual Server) to support any number of machine tools, files, remote requests and machine load-balancing which is a must requirement for a large shop.

Virtual Server's Features:

Floating Machine Tools

SuiteFactory Machine tools are object oriented in design. Once you setup a machine tool you can copy it, save it and or assign it to any Virtual Server on the Network by simple going to the properties window of the machine tool setting,

selecting the Virtual Server and the available communication port and you up and running within minutes. You don't need to shut down SuiteFactory it just happens.

Machine Load Balancing

Chose an existing or create a new Virtual Workstation and assign the machine tool you want to off-load to this new/existing Server and by reassigned it in real-time and you are up and running and back in business.

The off-loaded machine tool can be accessed from any workstation on the network by any other workstation/virtual server as before by the same Users.

User Workstations

Workstations can be created from the pool of licensed Workstation/Virtual Servers with no restrictions.

Unlimited Third-Party Invocation

Each Workstation/Virtual Server can have any third-party application associated with it and used by SuiteVault to launch any third-party application needed to edit any file or document in SuiteVault.
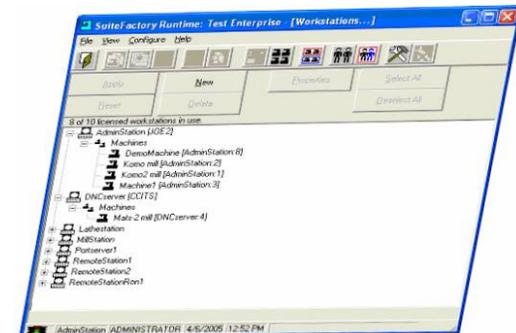

Folder Free Remote Request

Setup remote requests to control the type and quantity of files being sent to machine tool such as Production Control designated files.
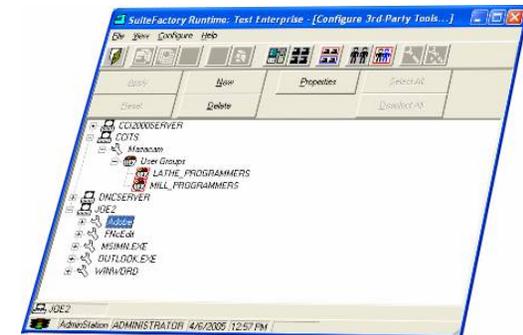

Single Point Configuration

No multiple Servers to configure or backup or provide security for. As a true Relational Database System SuiteFactory is an Enterprise Solution.
